### CHAPTER 1

# INTRODUCTION

This chapter gives an overview about the aim, objectives, background and operation environment of the system.

### 1.1 PROJECT AIMS and OBJECTIVES

The project aims and objectives that will be achieved after completion of this project are discussed in this subchapter. The aims and objectives are as follows:

- a. Image Cropping
- b. Image Classification
- c. Creation of Unbiased facemask dataset
- d. Requires less memory

# 1.2 BACKGROUND OF THE PROJECT

Face mask detection System using Convolutional Neural Network (CNN) is proposed system to classify face mask detection using Image classification. It refers to detect whether a person is wearing a mask or not. In fact, the problem is reverse engineering of face detection where the face is detected using machine learning algorithm for purpose of security, authentication and surveillance. Face detection is a key area in the field of Computer vision and pattern recognition. The primary research on face detection was done in 2001 using the design of handcraft feature and application of traditional machine learning algorithms to train effective classifiers for detection and recognition.

In recent years, face detection methods based on deep convolutional neural networks (CNN) have widely developed to improve detection performance.

### **1.3 OPERATION ENVIRONMENT**

PROCESSOR	INTEL CORE PROCESSOR OR BETTER PERFORMANCE
OPERATING SYSTEM	WINDOWS VISTA, WINDOWS 7, UBUNTU
MEMORY	1GB RAM OR MORE
HARD DISK SPACE	MINIMUM 3 GB FOR DATABASE USAGE FOR FUTURE
Table:1	

# CHAPTER 2

# SYSTEM ANALYSIS

In this chapter, we will discuss and analyse about the developing process of facemask detection System including software requirement specification (SRS) and comparison between traditional and existing system. The functional and non-functional requirements are included in SRS part to provide complete description and overview of system requirement before the developing process is carried out.

# 2.1 SOFTWARE REQUIREMENT SPECIFICATION

PRODUCT DESCRIPTION:

The task of recognizing the mask over the face in the public area can be achieved by deploying an effective object recognition algorithm through surveillance devices. We review the recent development in region proposal techniques using detectors, general technique for improving and pre-trained models based on these techniques.

# 2.2 SOFTWARE AND HARDWARE REQUIREMENTS

This section describes the software and hardware requirements of the system.

# 2.2.1 SOFTWARE REQUIREMENTS

 Operating system- Windows 7 is used as the operating system as it is stable and supports more features and is more user friendly

 Development tools and Programming language - Python is used to write the whole source code with PyCharm being the IDE.

# 2.2.2 HARDWARE REQUIREMENTS

Intel core i5 8<sup>th</sup> generation is used as a processor because it is fast than other processors and provide reliable and stable and we can run our pc for long-time. By using this processor, we can keep on developing our project without any worries.

 Ram 1 GB is used as it will provide fast reading and writing capabilities and will in turn support in processing.

# 2.3 SOFTWARE TOOLS USED

**Python** is the interpreted high-level general purpose programming language. Its design philosophy emphasizes code readability with its use of significant indentation. Its language constructs as well as its objectoriented approach aim to help programmers write clear, logical code for small and large-scale projects.

Python is dynamically-typed and garbage-collected. It supports multiple programming paradigms,

including structured (particularly, procedural), object-oriented and functional programming. It is often described as a "batteries included" language due to its comprehensive standard library.

PyCharm is an integrated development (IDE) used in computer programming, specifically for the Python language. It is developed by the Czech company JetBrains (formerly known as IntelliJ). It provides code analysis, a graphical debugger, an integrated unit tester, integration with version control system (VCSes), and supports web development with Django as well as data science with Anaconda.

**Machine Learning** is a branch of computing which originated from the study of the recognition of forms and the theory of computerized learning in the artificial. Rather than following rigid system instructions, these processes use model generation from model inputs to create data-based forecasts or selections. Arthur Samuel coined the term Machine Learning, in the sense of solving a test machine with a machine.

Machine learning (ML) involves two types of activities:

- i. Supervised machine learning
- ii. Unsupervised machine learning

**Convolutional neural network** (CNN) is a type of deep learning algorithm that takes an input picture and assigns importance to different picture characteristic as weight and are able to differentiate between

them. Strength of a convolutional neural network comes from a particular kind of layer called the convolutional layer.

CNN contains many convolutional layers assembled on top of each other, each one competent of recognizing more sophisticated shapes. The construction of a convolutional neural network is a multi-layered feed-forward neural network. CNN are very satisfactory at picking up on design in the input image, such as lines, gradients, circles, or even eyes and faces.

Left: A regular 3-layer Neural Network. Right: A ConvNet arranges its neurons in three dimensions (width, height, depth), as visualized in one of the layers. Every layer of a ConvNet transforms the 3D input volume to a 3D output volume of neuron activations. In this example, the red input layer holds the image, so its width and height would be the dimensions of the image, and the depth would be 3 (Red, Green, Blue channels).

# CHAPTER 3 SYSTEM TESTING

### 3.1 TABLE DESIGN

Testing is an important portion that is to be carried out while developing any program as it helps to find the error if there is any error and helps to debug the program. Testing helps us to get familiar with the type of error and handle the errors with the necessary formatting in the program.

#### Test-1

Action	To check whether it can handle exceptions or not
Expected output	It should able to handle any sum of input of user
Actual output	The program was able to handle even the wrong input of user
Test result	The program runs in its flow until user closes it

Table 2

### 3.2 DATA FLOW DIAGRAM

### **CHAPTER 4**

### SYSTEM IMPLEMENTATION

### 4.1 MODULE DESCRIPTION

The project "Facemask Detection system" has been made using Python, Machine Learning algorithms and codes were written in PyCharm software. Public use of Facemask has been common in recent times since the beginning of new coronavirus disease outbreak. We now know from recent studies that a significant portion of individuals with Covid-19 symptoms (pre-symptomatic) can transmit the virus to others before showing symptoms.

So, it is inevitable for people of an overpopulated country like India to wear masks and let the work go on. Nobody can keep an eye on every people coming in the work space is wearing mask or not. So, the need of face mask detection system arose. The model in this paper uses Convolutional Neural Network. It is a deep neural network model used for analysing any visual imagery.

CNN takes image data as input, captures all the data, and send to layers of neurons. It has a fully connected layer, which processes the final output that represents the prediction about the image. As a whole, the architecture contains the initial fully convolution layer with 32 filters, followed by 19 residual bottleneck layers.

### 4.2 Dataset

Dataset is the major part for building the CNN model. More the number of dataset images is, more accurate the model will be.

The dataset used in this project is a Face dataset (with/without mask dataset) from Kaggle.com. The dataset consists of images divided into two masks classes:

- Images taken with a mask
- Images taken without a mask

### 4.3 Future scope

Across the globe many countries have made it mandatory to wear masks at all public places. You have to cover your face in schools, supermarkets, transports, offices, stores and all other public places. For this reason, we plan to update the mask recognition system and announce it as an open-source project.

This system can be implemented and the result can be seen on digital screens. This app can be used with any digital camera for identifying people who aren't wearing masks. The proposed technique efficiently handles occlusions in dense situations.

Finally, the work opens interesting future directions for researcher. Firstly, the proposed technique can be integrated into any highresolution surveillance devices and not be limited to mask detection only. Secondly, the model can be extended to detect facial landmarks with a facemask for biometric purpose.
